

Initializes a Git repository in the current folder.

`git init`

Permanently saves the changes in the local history with a descriptive text.

`git commit -m "mens"`

Prepares all current changes for the next save (Staging).

`git add .`

Shows the modified files (red) and those ready to be saved (green).

`git status`

Changes the name of a branch (e.g., from master to main).

`git branch -m <new>`

# Git Cheat Sheet

Connects your local repository with a remote one in the cloud (e.g., GitHub).

`git remote add origin <url>`

Creates a new branch and switches you to it instantly.

`git checkout <branch>`

Merges the changes from the specified branch into your current branch.

`git merge <branch>`

Quickly uploads your new commits to GitHub (after using the previous command).

`git push`
